

# Manual provision of a server. Why?

1. You might want to change the region (to optimize costs)
  - You **cannot** change it later
2. Your company may already have a GCP project and you want to continue using it
  - **Important:** that GCP project must NOT have App Engine in use

# Steps for manual provision in GCP

1. Enable Cloud Build API
2. Link Billing Account to that GCP project
3. Run Cloud Shell Script, paste your Container Configuration string
